WHAT IS OCD

Obsessive-compulsive disorder (OCD) is a form of anxiety that develops when a person repeatedly experiences intrusive and unwanted thoughts, images or urges (obsessions) and performs compulsions or rituals to relieve their anxiety.

Common obsessions include thoughts about: contamination; harm coming to oneself or others; the need for symmetry, exactness; and upsetting sexual, violent, aggressive, or religious thoughts or images.

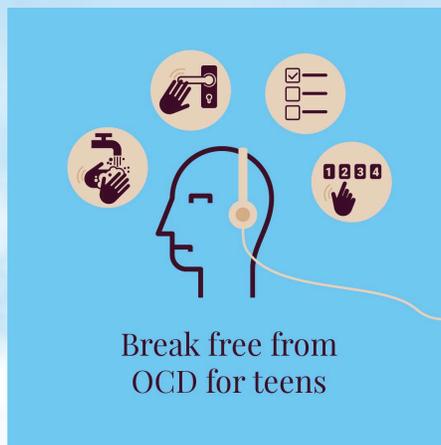

Common compulsions include: cleaning; hand-washing; ordering/arranging; hoarding; counting; checking; touching; repeating; and confessing.

Help may be needed when these behaviours become excessive and interrupt daily living.

OCD TREATMENT

Cognitive-Behavioural Therapy (CBT) is currently the **most effective** treatment for OCD. Even for individuals with very severe OCD, this treatment often results in significant improvement.

The treatment involves gradual Exposure where clients are asked to deliberately confront anxiety provoking thoughts, objects, or situations, followed by Response Prevention in which clients modify or stop rituals that they have previously engaged in as a way of relieving obsession-related anxiety.

GROUP THERAPY

Advantages of group therapy include:

Cost Effectiveness: Group therapy is more cost-effective than individual therapy for OCD.

Social Support: Much suffering stems from the feelings of isolation caused by OCD symptoms. Group therapy allows your child to see that they are not alone and that others are struggling with similar challenges. In addition, other group members often have great hints and tips for coping with OCD.

Motivation: The shared experience of tackling OCD can be very powerful. Group members, both teens and parents, provide encouragement and support for each other throughout the program.
